

Case 1: A dog is aged 5 years old was brought to clinic for having a car accident. When the clinician examined the case, signs of fracture were expected. The clinician sent the case for the radiological unit to have a plain radiograph on lateral view.

Radiological report:

Dear colleague.....

According to your referral report about the dog is aged 5 years old and suspected to have fracture, the plain x-ray lateral view showed complete oblique fracture at the mid-shaft site of the femoral bone affected slightly on the soft tissue surrounded it due changes in the opacity of the soft tissue surrounding the site of the fracture.

Sincerely

The radiographer name and signature

Case 2: A dog was suffering from swelling within the lower abdominal cavity according to the report that was sent to the radiographer by the clinician. The clinician asked to have plain radiograph for identifying the severe constipation that animal has.

### Radiological report

Dear colleague

I would like to inform you about your case the dog that is suffering from clinical swelling within the abdominal cavity. The results showed the following

On plain radiograph lateral view, the radiograph represented distended transverse and descending colon filled with dry feces. This suggested long term constipation.

Sincerely

The radiographer name and signature
